

CHAINTRADE

Audit results:

Here is the critical error that was found, that could affect the whole ICO execution. It could result that ICO could never end, and programmed bonuses distribution.

Bad logic is in construction `numberTokenSold = nbTokens;` on line 193 because it overrides value of `numberTokenSold` but it should add sold tokens `numberTokenSold = numberTokenSold.add(nbTokens).`

on line number 127, instead of `uint256 public numberTokenSold;` should be `uint256 public numberTokenSold = 0;` or this sets value in constructor.
